

on data catalogue. I'll actually you that out a little bit more. I want to say Lawren, thanks for letting us steal this time. Thank you team for making this work. Russ, I'll hand it over to you and we'll just kind of dive into the topic. Sounds good. Yeah, thanks for setting this up. Lawrence. Good to meet you, as well. Good to meet you. So. I think the best way to describe this work that we're trying to do is to kind of start with, what can do with privacy. assessment in Carmax, right? So they want us to identify each asset. Like, in our case, asset, think of it as a set of schemas, right? in our lake, right? They want us to identify what's in each of these assets, right? Okay. And they want us to identify based on some classifications that they have done, right? Okay. They're calling it elements, but the best, I think, the closest technology that I can probably use that everybody uses is the classifications. The problem for us is that we have no classifications or knowledge, right? So we have a bunch of tables, columns, most of them are we don't even know what's in them, right? Right. as the data and unit organization. So first thing we wanted to try and do was to maybe automatically generate some descriptions and then maybe use that to match, right? Right. Again the classations that our privacy seek wants, right? Right. But the better approach to that is maybe to give some LLM that's available in the data bricks. the specifications they want and see if it can do a better job of identifying which columns in a table fits within which classification, right? Okay, okay. The other carry out to this classification is that we don't have a proper description from this privacy theme on what it means. So we have to do some interpretation, right? Right. What I have talked to them and they've they've basically engaged legal connection. It's okay because given the number of tables and columns we have, they're okay with as long as we can say, here's the process we followed and it can be used of an LM, right? Yeah. They're okay with accepting what what it gives it. Like, it doesn't require us to go and manually you know, validate anything.. So LMS says these column matches with this with, you know, this classification, then. Okay. No, that, no, that definitely makes sense. And so then my question would be, is this data all in data breaks in the leg? Okay. Okay. Okay. So let me see if maybe I can show some functionality within the databs platform that if this gets us close to what we are looking at. And this is just inbus, but if we want to create something custom as well with LLMs, we can also do that. But under our catalog, so let's say we implement unity catalog. This will host all the assets that you have, your catalogs and your schema and your team tables. We have this hub here called the Governance Hub. And so here, you can govern tax if you have tax. In this case, we can use LLMs to tag some of these data attributes as well. And then we can also do the discovery. But then there's also like data classification. That is based on what that data is setying or maybe the tag that you give. So this will come prepopulated for you based on their assets. And so I guess we have some, you know, I think, already in the platform, but we can also get to where you are in terms of like tagging and work classification naturally mean for Karmax. I don't know if that makes sense. So can we give a custom set of tags orifications for it to go and identify what's? Yeah, we can do that with LLMs and say, hey, if we see this, we're tagging so we can tag all the assets, and then that will show up here for a dashboards or whatever you need to hand it over to compliance team. Yep. It seems like a pretty straightforward way to get this done. I didn't think it was it would be this simple.. But Matt and Dana, do you what do you think? I think you are also a little bit more closer to this problem. Yeah, I was gonna say it might be helpful to look at some of some of the classifications that our legal teams are looking for. I think some of them are so broad and undefined that this is kind of what you're referring to earlier, Rosa is like, I don't know how an

LLM is going to interpret these things. So, like, if there's a way we can prompt is not the right word, provide more common context or detail and kind of help it out a little bit, because, like, I mean, some of the classifications are what, like,, I don't know, R, if you could maybe pull. Yeah, yeah. Yeah. And so, Matt, just to answer your question, right? The LLM can help as much as, you know, the information that we give it, right? And so, I think if we are okay, we can stay on metadata, just the names and then the columns, but that will come with some accuracy hit. If we try and say, let's say, we're giving that LLM maybe the first two or five rows of the data, we have simple, I would say, functions called generate sentiments, which we kind of use in our core sense analytics or whatever to just, you know, skim through and see what that field means. And then it can compare against the tag requirements that we have and populate the tag. Okay. And Matt, for what it's worth, I think you said the word prompt, I think that is the right word here. If we can figure out the prompt to ask. And even, Lawrence, to your point, even if we have inaccurate results, at least it's to start en masse, right? Because otherwise we're going to be doing this one by one ourselves, so if we can get the LLM to tackle this and give us 80% accuracy, that's 10% should be easier for us to tackle. It's kind of my thought process, but that's not actually in the weeds. That's the optimism going into that. Sure you're going to give a hand up. Yeah. I have the question on the same notes. Also, Lawrence, like, how much confident confidence is there in the model to identify that as attack right now? Like whatever it is, the tag is identified as some some classic. So from databricks, like how much confidence level it is that that is being identified as cur? Yeah, so by defaults on the platform on data bricks, the AI generated or the tagging, it's, I would say it's fairly accurate, but then again, I'm not going to sit here and say it's an , right? And so we also recommend that there has to be a human, let's say, loop. And so I think understanding this requirement, what I can do is that I can take this as an action item and try to put something together as a POC or a working, you know, solution and then come back to the team and see how that that looks. Yeah, I mean, like, we just want to see that one. Is there any overlapping of the tags and we have implemented this one, right? So we will be defining the tag and definition of that one, but like the AI model can interpret this one as a, like, you know, combine this one, so it has to segregate, right? So we won't understand how much confidence it has to assign that one decide to decide when it is assigning a tag. We want to see the confidence of that one as well. Okay, okay.. I got. Yeah, not just the results.. Yeah, yeah. And also, like, yeah, human interface, when you said that, like, similar to what we have, what you have demo as per descriptions part, that at, right? So similarly, if we can have a UI or something like that, like where user can go and change something, if he's not feeling that one, this is not the right tag and he can choose the other tag also. That would be helpful for us. Yeah, yeah, I can I can I can put something together. And I think,, again, it's not that I'm just natural and to say that I'm confident, but then again, I'm also aware that technology. It's elegant, right? And so. It's totally fine. Yeah. I just want to understand the right? Soigning to anything, we want to let our management. This is the confidence level from the AI. We got it. Yeah, yeah, yeah. No, no, I totally agree. And one thing that I've seen that actually work well is that if we, in this case, we have tags, that we're trying to make sure that the data that is coming through is getting tagged properly, I think that LLM does a good job based on what I have I have done as well. So I'll work on something and Yep. Yeah, just a quick followup on that Lawrence. So you mentioned, you know, initially this is something built into data bricks. So the confidence score is something that's available built in that can be captured and stored or human to look at those scores and make

adjustments or that's a custom development, you know. That's. So the customs score in data breaks. So this, I would say this is a native of data breaks itself, right? So data breaks at the moment is, is just, I would say, GAI platform. And so this comes natural from AI generated. Now, DAS score getting that ASO what have to be something maybe I would say, I'll have to work with product to see if we have a score for that and I can get that for you. Now, we can also get a custom, which I am proposing for, which that one who will have to benchmark ourselves or maybe just create scores ourselves. But either way, I can speak to products and say, hey, you know, the semantic model or semantic model that we have on the platform, what is the score? And so I can get that information over to you guys as well. I don't Lawrence, can you show the screen again one time for the girls. Okay, let me shake my screen so that you can. Okay. Yeah, sorry. Let me. Let me. I just hoping this one of this one. Yes. You're seeing this one, this is. Govern and tax, yes. This is the one were created? Yep. So, but how that it is displaying in the catalogue, when we, you know, define a tag. So when we go to the data set or like a table, right? Mm. There's going to be a section of the, let me check on my side. This one? Yep? Let me get your screen again, yes. Yeah. Yep. Okay. So if, like we define all the tasks, this is it automatically populator here on all the tables? Yes. That's that's the point. That's the governor's hug. Yep. Yep. Got it. Thank you. Yep. And you can also just classify them based on certified a lot of, you know, like the governance to what they do, certify the data is ready to go, you can also do that as well. Got it. Yeah. So automatic linea also comes to the picture, once we have all these definitions defined, right? That is correct. Okay. Yep. What about these policies you are now? It's there, the new one policy is? Let me share your screening. see your screening. I was off your screen. Sorry about that. Sorry, sorry, it's. No problem. It's okay. These policies? Oh, this policies are, let's say if you have like maskine policy that you want to create or So as you can see, mask columns, high tables. So it just depends on how you want to take this policy, right? If you want to restrict that as well. But for cases that I have seen myself that I have used as more like masking and restricting some access. But I'm sure it can do more. So I'll have to check that.. So, yeah, this is the specific feature I was looking. The tested tax also, we can apply this policy, right? Yes. things. Okay. Okay. Yep. Got it.. Thank you. All right. So, I think I have so action item. I can I will take this back, prototype, and then, you know, share with a team, and then we can reconvene as well. if that makes sense, Nick, for the next steps. No, it definitely does. I see Russia's hand popped up and I was going to check on him this see. Okay... I know I didn't get the chance to go over the the spreadsheet. I can check with our folks to see if I can share this with you. So I have like a reference. That would be great. I don't think it's a problem because it's just some definitions, right? Yeah. There's nothing comic specific here. So the way they have it is like a subject name and an element name, right? So this is what we need to match to. This is what I will say transification. One we can try and do is to feed this into like a co-ilot or something they have access to and see if we can actually generate a description. If that helps you or data bricks in a way that it helps the matching, that you can try and write a description for this as well. Yeah, that would be great. That would be great if you can share that so that I think that that will be more close to a solution more than anything else. One thing to consider, too, we don't actually expect all of these elements to have some hit in our space. And so one thing I want to be careful of is just flying something because we think it needs a flag. Like, some of this stuff up there, like some of the data points up there, we know what we have never asked to don't have in our data set. But this is a big list. So that's sort of the

AI concern I have in the back of my mind. The AI would just say, yeah, this is somebody's marital status when it's not, right? Yeah, yeah, that's another thing that kind of we should probably, that's why I was thinking, you know, get DV to some sort of a pre pre work on this spreadsheet itself. He's like, I was just looking for iColor, right? So if I search for this. Right, right.. I don't know. Okay, so I call. No, it's in there. A line 17. Yeah, line 17. Yeah, but..... What did I do? Okay.. Okay, there you go, right? So it's repeated three times, right? So for us associated, it makes sense. But they've repeated it for even for B to B. Like this shouldn't, like, that makes no sense. Right. So it's the same, this 171, no maybe close to it, it's getting repeated for each other, like for associated the B toB and a consumer. Okay. Right? Okay. So, like, really we'd want to tag it to see if it's a dictor or or a customer and then the 170 170 elements that we're asking. The reason I did, so I did say we searching if we don't have some of this information, I could be wrong, right? Like, part of it is, I don't want to unnecessarily buy something that we don't have, that we don't expect to see, but I also don't want to be blind to the fact that maybe somewhere nested is what could be, you know, aptitude. I can't imagine asking aptitude on the form, but.. Yeah, yeah, yeah. So most of these don't have, and I think what we need to think about is like, regardless of this, we can, like, there's only 171 trust we need to work on. And then we already know what maps to associate and what, like which tables map to associate and be to be, right? So if you can identify if any of these are there, so then it's less number of lessations we have to deal with. It's what I was thinking. So I'll see if we can share this with you. Yeah, please. Yeah. And go from there. Sounds good. Yeah, Ros, thanks for taking the action to check with the team. I think that's. I also would have just probably shook it off and said, yeah, we can share, but I check it first is right. And then sharing it is great. Lawrence, thank you for taking what sounds like three or four homework assignments coming out. No, that's no, that's fine. I think we have something that's where we can build up on and then apply these tags. So yeah, we should be good. My last question is, is there any kind of like other than like the data list that R sending over and Lawrence, you put in some things together and how we test this, is there any sort of like setup or prerequisite or some kind of configuration thing we need to go through to put ourselves in a position to run this? I didn't It sounded like.. No, no. I think it's just maybe Yy. That's just going to be needed. But yeah, other than that, even for that, I think if based on a solution that we choose, we can populate some of them. But let me take this back. Share the spreadsheet and let me work on it and get something going.noon. You're next. Yeah, I heard a last question along the same line, Lauren. So as part of the UC setup, I know you mentioned just the UC setup will accommodate this. Is there any LLM processing bill that's outside of DU consumption when these definitions are generated that we need to pay attention to or it's all factored in the UC modelistically. That's That's a good question. So for UC, if we're trying to leverage, and I'll try and leverage the platform itself as much as possible, that already has the LLM, I would say, baked into the platform, right? I think that's the acquisition of mosaic that we did. So that's already there. But if I'm creating, let's say, as custom solution outside of this and we have, let's say, a UI interface to give us this, you know, input, then that is where we will, we will be thinking about the AI model that we're calling all the LLM that we're calling to do that generation as well. But that is also not a separate bill, but that comes with compute. On database, it's just the compute. So it's not outside skill. Outside bill, I would say. Great question,ran. Such a great question. What is this going? Is it different? Thank you. Thank you. All right, any about my questions, any other questions before I

give some time back to people on a Friday??, I'm going to let it go for two more seconds of Silence. And then I will say, once again, Dave Rs is a partner. Thank you guys for jumping on this call and prioritizing this work. We've got a couple things spinning out of this. I do think Lawrence at a minimum will circle back next week. time on the calendar, same group, maybe a different, not Friday. But check back in on status. We can't get updates to email, but I think a quick chat is probably the fastest. Yep, that would be great. Awesome. All righty. Thank you, guys. We'll see team, thank you so much. Happy running. All righty, too, now. Bye. Bye.. These that have multiple IDPs, but, yeah, they would have toate a super blocks and have that other system also working with that same IDDP, too. I've already thinking about a bunch of customers, but this would be relevant, you know, Great.. And I just add to, there are we have customers with other unique setups as well, so maybe they have to hit, like a custom endpoint to facilitate that exchange, so that is possible that it is preferred to like leverage the IVP just that everything is consistent. But there are, as always kind of hacks that if someone has a more complicated environment, we can make that work as well. So May I saw you have a question. Hey, yes, so when you show the git, like Dar essentially indicate that you are able to do worsening of the application as you deploy it, and how does CICD, for example, work as I try to make progress between my dev staging and fra environments for these apps? Yeah, good question. I'll get into that. Actually, just showing GitHub in this case, you can think of GinHub as a data source. So, like, say, you wanted to track Instacart testis, for example, like, developer productivity, you could actually pull like all the, like the commit requests, pull requests, things like that, and create a data dashboard to show what's going on inside your, again, your gitH account. So that's that's is reflected here. However, to your question, yes, there is the ability as you're building applications to integrate with gitU as the source code control system. I'll show that inside of the application where you would do that, you basically would just make commits from the individual editor inside Super Blocks. Those commits would show up inside your gitHub, and then you can, you know, create full requests kind of follow your traditional SDLC. Consistent with why what said before, we're not trying to get you to reevent all these processes. We're kind of like bolting into these existing, you know, software development tools that you have so that you can just kind of do things as you do today. But I'll show a diagram a little bit later, that kind of highlights the way that would work in greater detail. All right. Thank you, Nick. Yeah. Okay. Um, actually, just one other final point too, just to kind of, um, it's relevant to what you just asked as well. You can set up multiple configurations per integration. So these would be uniqueunique set of credentials, right? But oftentimes as you're developing, right, you're gonna have a set of credentials for to have, maybe one for staging, and then another production. And so one of the nice things about our platform is there's always one version of the application that you're building, and then you are you're doing is just redirecting the piping on the backhead. So we have a concept called profiles. You would basically tag each of these configurations with a specific profile, and so you can see that tag up here at the top. You, this one that one was production, this one staging. But again, the biggest benefit is there's always a single version of the app. You don't need to download it and then, you know, push it somewhere else. You can just continue to promote it through the software. life cycle, all within the superblock c. Okay. All right. So that's kind of at like, a high level. Again, I just wanted to keep that tuning, but wanted to show some of the platform features. And so now, like I said, I wanted to showcase just how we are able to build demos for prospects so quickly. The way we've done that is we have what's called a demo

center app, and so this is all created inside superblocks. You actually see, I just hit the top banner here, but this is like, what's called the visual editor. And so this is where you can chat with Clark, this is that chat window inside here. You also have the ability to switch modes. So right now I'm in interactive mode. But again, we kept that dragon drop experience, and so I can click specific components, and then I can make changes this way as well. And then there is also a third layer, which we call code mode, but that's where we're able to inspect the reAC code. What we found is like, you know, engineers that like to work in their IDE. They're gonna continue to operate in that manner, and they can use, you know, some of the AI IDE tools, but say semi-technical folks are gonna use either the chat window, the dragon dropped interface, when it comes to actually, you know, making changes to the app. Okay. As far as then, just the way this app works, so I'll kind of walk through, like, all these different cages that we have inside here, but the way we've set it up is so that there's just this workflow, and you kind of see all the different steps of the top here. And so what what I can do is I can type in any company name one second. This over under real quick. Okay. Yeah, I can type in any company name here. And then this is where, again, I'm say I'm gonna do a demo for data break for you guys. I can then just validate that the AI that's sort of happening by behind the scenes, that knows the correct company that's in context. So I can just interview a summary. I can then click out of that, and then what I will ask it to do, and this is actually making calls in this case, to clod on the back end. This is this is not the AI agent that we're calling. We actually set up a clod as a data source in this case, but it is going to generate several use cases for me that I will then generate a prompt that I could submit to Clark. And so, yeah, yeah, you guys have more than that in terms of employees, so that needs to be updated. But, that's just being pulled from AI. But again, yeah, you'll see here. So as far as the used cases is right, this is what it's coming up with, as far as, you know, things that would be potentially of interest. I could go back and provide it, like, additional context to kind of, you know, help guide what type of use cases I want to say. But let's just say I want to create, like, a sales pipeline, analytic dashboard. And so what's gonna happen now is it's actually going to generate the prompt for me, that, again, I could then, submit, and I can after that, I can also then enhance it with AI. But we've set this up so that it will kind of follow a consistent format. And so the prompt that would ultimately get submitted is I want to build an internal sales app, you know, for data bricks for a new office. operations team. You know, there's a couple other details, too, in terms of I want it to be modern and use the data color. We do provide the ability to integrate with the company's design system, but you can also include in the prom things like HX codes, so that, again, you know, the color and everything is consistent, with the company's design standards. And then you'll see here, too, we've just listed up the features that we want to include in the app apne. So things like a header, a navigation bar, metrics cards, things like that. If I wanted to, again, I could adjust the brain colors at the bottom. Okay. Now, one of the other unique things, too, when it comes to super water, blogs versus some of those other solutions, is the ability to integrate with your business systems, right? Like, oftentimes, you, lovable, bold, things like that, they're great for prototypes, but when it comes to integrating with, you know, postgressed data, breaks data breaks, you know, it's not oftentimes fall short. And so what this next step in this application is doing is actually generating fake data for me, and then I'm going to be able to write it to these data sources that I'm gonna, you know, select from a drop down. And so I'll be able to easily write it, you know, ofentimes we use these like postgrass data breaks, of times good. I am well, Rob. I am well, Rob. Thank you.

Oh, I see the Indiana going on. There we go. L. I'm sorry. Yeah. There we go. There we go. Thank you, thank you, Ralph for your time again. Nothing. I would say I'm looking forward to the holidays for sure. I plan on taking a few days. It's actually seven days to travel to Ghana. That's where my family is. And so just to visit them as well. So, yeah. It's in West Africa. Yeah, through JFK or Atlanta, and then I can get a n flight there. North Carolina, yes, that is correct. Yes. Yep. I was there last two years to see my mom, so that was great. No, so my three-year old will just terrorize me for that trip. So for this time, she's staying back with the mom. Thank you. In terms of work, work is really going on, well, I would say, we are, I think there's more to push to the end of the year. One thing that I think I'm excited about is we getting close to the commissioning RDW. I think it's it's it's great. So that's, I'll take that with me as a win for the year and and then come back next year with with the other systems... That's that's that's that's actually a good point. But one thing that I've realized is that we can say we're ready, and even when we come to the cab, you definitely will have some questions that will have us scratching eye head. So I'm confident we're ready, but I'm also, you know, would leave room for you to sp.. Oh. Mm. Mm. Yeah. Yes, yes. That's correct. Mm hmm. That's that's correct. Mm hmm. Is it is it Yes. Mm hmm. Mm hmm.. Kim. Mm hmm. Mm hmm. Mm Right. It's your favorite pride. I agree. It's a do, yeah. I agree. I agree. No, I am. And and trust me, those inputs and, you know, your suggestions are something that I really truly do appreciate. And so no complaints at all from my side. But yes, we are trying to we are taking a method call approach, starting with the QA disconnecting the QA a little bit. And then we' move on to the pri as well. And I think the EDW team will try to run in Korean to see if maybe for a couple of weeks or a month as well. So I think we're getting all our decks in the road to see to be. So I started in February 24th next year, so approaching 10 months.. Yeah. Same one, yeah. No, I think it's great. I've had a lot of help from Kevin. as well. So getting up to speed and understanding the different jargons and business abbreviations as well. So that really helps in terms of the business itself, I'm still trying to get up to speed there, but from the technology side, I think it has been great. So I've been blessed to be involved in the tablo migrations from the legacy. And so now it feels like I have the wealth of knowledge from the new technology that started. And so and so I take that with me. But it's been great. I have been learning a whole lot. I I was, I had a lot of, I would say, AI experience and then ambitions. But again, it's not that I'm not able to use them. I think there's a process in terms of the industry as well. So there has to be governance as well. So there is a lay down process, which I think it's coming along. So no complaints there at all. In my past world being a consultant, you, you can just go AWOL and just, you know, play with the AI, but it doesn't work that. way in financial service. Yes. Mm. Mm hmm. Yup. That's great. Mm hmm. Yes. Yes, yes Thank you. Yeah. That. That's correct. That is correct. Yep. Mm hmm. No, this is great. No, if you, I think you're spot on, but Ed's been great. I can't honestly not complain. I wouldn't have anything to complain about.. So, yeah, I'm happy to be here still. Yes, we do. But I think we kind of we're both introvertters, so it's more about staying home and just doing something home and relax. relaxing, honestly. Nice. That was nice. Mm hmm. Nice. You turkey, yeah. Mm hmm. Yeah. Oh, man. Man, that's not good. I guess that's the that's the trade-off. Yeah.. Well, yeah, yeah, this time it's you. I hope you feel better soon. Um, not really, but, um, I promise next time maybe I'll come in with a lot of stuff Chris. Hmm.. Yep.. Yep. Sounds good. Thank you. Thank you. sir. Thank you. Thank you, and if we don't get to talk Merry Christmas. Right. No. Mm hmm.
